# BLUEMED

Real-time Remote Patient Monitoring with wireless medical devices

Our solution collects medical and other forms of health data from all medical devices and electronically transmits that information securely and anonymously to health care providers and clinicians.
A dynamic and semi-automatic user's tasks generation based on patient's values and taken actions, will guide the clinicians through procedures.

Why is remote monitoring next big thing?

Quick & Easy to Use
Access real-time data from anywhere on any device, simply by scanning a QR code.

More patient outcomes
Because of the **flexibility, customizability** and **mobility**, patient monitoring has never been easier.

Data protection
We transmit **anonymous data** to garantie patient's privacy

What we offer

Installation
The solution is available in cloud or on-premise.
We take care for the on-premise installation and the integration with AD and ADT.

Seamless Integrations
We provide our medical devices but we can also easily integrate the existing and sync your data in real-time

Formation
During implementation the personnel will be instructed on how to use the platform in order to be independent.

Customization
Based on customer requirements the platform will be adapted by adding new features free of charge.

Case Study

In collaboration with an intensive care hospital, we tested our monitoring system on a dozen of patients.
The correctness of the data collected by the devices has been verified by nurses.
